Re: Streamlining Deployment of Small Cell Infrastructure:

NIH Investigation Confirms Cancer Threat from RF Radiation, Cell Phone Sites, SmartMeters,  
*etc.* at Radiation Levels Officially Considered Safe

RF Exposure Levels Must Be Reassessed Before Any Additional Radiation Sources Installed:

Until Reasonable Safe Levels Are Established, Additional Radiation Sources Must Be Halted:

The Proposed Streamlining Is Immoral If Not Murderous

Dear People:

The definitive US government investigation whether cell phone / microwave / radiofrequency radiation (RFR) can cause cancer gave results no one wanted:

The National Institutes of Health's NTP investigation found a type of cancerous brain tumor solely in radiated lab animals that is also becoming more common in we humans..

Plus a rare type of malignant heart tumor was also found solely in radiated animals, similar to tumors other RFR investigations found.. as well as "potentially preneoplastic lesions."

Especially striking is the complete absence of such tumors in the control animals not radiated. Most egregiously, cancers occurred even at radiation levels below the federal government's current recommendation for limiting exposure.

There was also no consistent relationship between intensity of the radiation and risk of tumors. Furthermore, humans tend to be more sensitive to noxious influences; the animals used in the NTP investigation, rats are particularly hardy critters.

Such blatant results demand action, especially after ever more evidence of harm from exposure to electromagnetic radiation (EMR), including RFR, has continued accumulating for many decades, around the world.

Further debate is not justifiable, certainly not morally.

Many more details and a link to the NTP report can be found at [RadiateNot.me](http://RadiateNot.me). To read the report itself, plus quotations from *The Wall Street Journal* and other media about, scroll down about two screens to: "NEXT: Major US study finds link between cell phones and cancer."

The unfortunates among us who sense, and especially those unable to tolerate electromagnetic radiation are like canaries in a coal mine warning of hazards insensible to most. – Actually, they are *fortunate* being forced to avoid such harmful exposures.

For more than a century, many scientists resisted the idea low levels of EMR can harm living organisms, primarily because they saw no way EMR could cause such effects. RFR too weak to heat flesh – as more intense microwaves do – was believed – rather, *wished* to be harmless.

Although science still struggles mightily to explain these deadly effects, and far more remains mysterious to dumbfounding than clarified, vast evidence ended the era of denial years ago.

The strikingly definitive NTP results added a seal to that tomb, making it maximally hard to justify revisiting – especially such a rigorous effort. (It cost tens of \$Millions over 15+ years.)

Now facing us all are many years if not decades struggling to find the healthiest balance between essential radiation like radio communications emergency services depend on, *vs.* the harmful, including deadly consequences of too much.

The future will judge anyone ignoring EMR hazards in decisions like adding more cell sites and installing so-called SmartMeters and Wi-Fi, now threatening billions worldwide.

If there is a reasonably safe level of radiation, it remains unknown.

With grave concern,
